☑ Model

3-way-valve with outside parallel thread, according to ISO 228/1, with flat seal, pipe connections are not included in package. Spindle made of stainless-steel, brass valve cone with glass fibre reinforced Teflon sealing. Brass stuffing box with EPDM O-ring, DR brass body.

Using mixing and diverting valve **4037** gives an advantage to usual installations as there are no sealing edges and so cannot be worn, and thus leak. Even after long service the leakage rate will be minimal.

☑ Operational data

Max. operating temperature - 15 ...+ 130 °C
 Max. operating pressure 16 bar / 130 °C till DN 32
 16 bar / 110 °C for DN 40 and DN 50

Valve characteristic: linear
 Leakage rate norm branch < 0,02 % from the Kv-value
 (mode) admix branch 1% from the Kv-value

Heating water according to ÖNORM H5195 or VDI-Standard 2035. The use of ethylene or propylene glycol in a mixing ratio 25- 50% is allowed. EPDM gaskets can be affected by mineral oils lubricants and thus lead to failure of the EPDM seals. Please refer to manufacturers documentation when using ethylene glycol and propylene glycol products for frost and corrosion protection. Too high differential pressure drop may damage the due to cavitation.

Application field

For constant control of cooling or heating water, or air as a mixing or diverting valve. Together with valve drives used as control device with adjustable characteristic curve (linear, proportional or square).

The control device may be mounted in any position, except vertically downward. Avoid penetration of condensing water, dripping water, etc. into drive. Assembling of valve and drive is possible without pre-adjustment. The drive is self adjusting as soon as voltage is put on the valve.

Installation

Valves are mounted in pipe system according to application (mixing or diverting valve) by means of commercial standard screw connections with flat seals. Avoid penetration of dirt into valves.

By the time the pin of valve spindle is extended, the path A-AB is closed.

During installation, be aware of the flow direction marked by an arrow on body.

The illustration shows the square characteristic for comparison

Linear valve characteristic could be changed by using the valve drive 1 7712 11 with fitted DIP switches.

Also possible:

- linear characteristic
- equal percentage characteristic

Common power/water quantity

$$\dot{V} = \frac{3600 \cdot P}{c \cdot \Delta T}$$

$\dot{V}$ = Volume flow rate [$\text{m}^3 \cdot \text{h}^{-1}$]

P = Capacity [W]

c = Specific heat capacity, for water 4,19 [$\text{kJ} \cdot \text{kg}^{-1} \cdot \text{K}^{-1}$]

T = Temperature [K]

k_v = Valve parameter for partially open valve [$\text{m}^3 \cdot \text{h}^{-1}$]

p = Pressure [$\text{Pa} = \text{N} \cdot \text{m}^{-2}$]
